Report 'Pax by Route' - the number of passengers (including children and infants) who flown to particular destinations

This report generates **Passengers** data, such as:

- **Total number of pax flying in a given period of time**
- **Number of children and infants**
- **Max number of pax - capacity of the aircraft (inserted in 'Fleet Edit' section)**
- **Number of flights to a particular airport**
- **Load factor - the ratio of pax on board to capacity**
- **Pax + children / flight - the ratio of pax + children to the number of flights**

The screen is divided in **2** sections: **Departure** and **Arrival**

In the **filter** you can select period of time, including days of the week. A particular airport (for both: departure and arrival) and data source (Plan only, Available or Journey Logs only) can be selected as well.
